

TERRA INCOGNITA

In 2016 the Terra Incognita Project and Dr. Michael Villanueva collected data on difficult reintegration experiences after receiving 5-MeO-DMT.

We helped to facilitate treatment for an extreme case of trauma with one client who had smoked 5-MeO-DMT and reported symptoms of brain damage. Some of the reported behaviors and feelings included: high levels of anxiety, depersonalization, detachment, decreased motivation, and or memory difficulties.

Dr. Villanueva's preliminary analysis of the participants' EEG undergoing toad suggested possible hypotheses; it was clear however that a lack of oxygen to the brain had resulted in neural damage affecting cognitive behavior.

A protocol was developed to entrain the clients neural patterns back to an optimal condition and in concert with other modalities to regain confidence and control of his life. Learnings were gained about the sensitivity of people with pre-existing blows to the head that may have weakened areas of blood flow associated with neural ischemia, and the dangers that can create to experiencing 5-MeO. We are harnessing the data and case study to share with other practitioners and medical parties.
